BACKGROUND

Pre-exposure Prophylaxis is one of the HIV prevention program that is currently being rolled out in Indonesia. To improve the quality of PrEP service delivery, Community-Led Monitoring (CLM) has been carried out in collaboration with HIV community organizations. While CLM is a common concept for HIV program monitoring, a lot of the results are still presented through anecdotal reporting mechanism. In order to gather and present evidence-based data from the on-going program, an additional tool is needed to capture and report the result of CLM. Therefore, a dashboard page is also developed to display the data that has been collected.

DESCRIPTION

CLM was implemented by PrEP Focal Point in 21 cities and districts, initiated by GWL-INA as a representative community organization in Indonesia. The aim is to systemically and routinely collect and analyze data on PrEP delivery in health services and how the program had been rolled out in each city or district. The results were then used for program improvements based on community access for PrEP itself. Data collection was carried out every three months starting in 2023, using online questionnaires developed by RC3ID Universitas Padjadjaran. Data was captured through Google Form while the dashboard page was developed on LookerStudio platform. All CLM-related activities were funded by UNAIDS Indonesia.

Service Aspect Evaluation

Program Implementation Score

LESSON LEARNED

The purpose of CLM is to serve as surveillance and accountability mechanism for health services, therefore the results are seen from the point of view of community as the main beneficiary of PrEP. Through CLM, we can see how PrEP is being provided through access experience and find out points that need improvements.

The dashboard page that presents the results of CLM can be used as the source of data for an evidence-based advocacy initiated by community-led organizations. With advocacy being carried out frequently, loops of rapid feedbacks and improvements are expected to reach the ideal PrEP service delivery

CONCLUSION/ NEXT STEP

An accessible dashboard page that displays data from CLM is helpful to gather accountable results and serve an evidence-based advocacy. It can be used as an additional tool for community-led organizations to carry out CLM in more systematic manner
